ECVAM European Centre for the Validation of Alternative Methods

STATEMENT ON THE SCIENTIFIC VALIDITY OF THE RAT SKIN TRANSCUTANEOUS ELECTRICAL RESISTANCE (TER) TEST (AN *IN VITRO* TEST FOR SKIN CORROSIVITY)

At its 10th meeting, held on 31 March 1998 at the European Centre for the Validation of Alternative Methods (ECVAM), Ispra, Italy, the ECVAM Scientific Advisory Committee (ESAC)¹ unanimously endorsed the following statement:

The results obtained with the rat skin transcutaneous electrical resistance (TER) test in the ECVAM international validation study on *in vitro* tests for skin corrosivity were reproducible, both within and between the three laboratories that performed the test. The rat skin TER test proved applicable to testing a diverse group of chemicals of different physical forms, including organic acids, organic bases, neutral organics, inorganic acids, inorganic bases, inorganic salts, electrophiles, phenols and soaps/surfactants. The concordances between the skin corrosivity classifications derived from the *in vitro* data and from the *in vivo* data were very good. The test was able to distinguish between corrosive and non-corrosive chemicals for all of the chemical types studied. The Committee therefore agrees with the conclusion from this formal validation study that the rat skin TER test is scientifically validated for use as a replacement for the animal test for distinguishing between corrosive and non-corrosive chemicals, and that this test is ready to be considered for regulatory acceptance.

The ESAC has been regularly kept informed of the progress of the study, and this endorsement was based on an assessment of various documents, including, in particular, the report on the results and evaluation of the validation study by the Management Team, which is to be published in *Toxicology in Vitro*.³

This validation study was conducted in accordance with the general principles laid down in the report of the CAAT²/ERGATT² workshop held in 1990,⁴ guidelines contained in the report of an ECVAM/ERGATT workshop held in 1995,⁵ criteria laid down by ECVAM and the ECB,^{2,6} criteria recommended at an OECD² workshop held in 1996,⁷ and the US ICCVAM² report on validation and regulatory acceptance.⁸ The outcome of a prevalidation study on *in vitro* tests for skin corrosivity was published in 1995, as ECVAM workshop report 6.⁹ A separate report on the selection of the test chemicals for the validation study is to be published alongside the Management Team's report in *Toxicology in Vitro*.¹⁰

1. The ESAC was established by the European Commission, and is composed of representatives of the EU Member States, industry, academia and animal welfare, together with representatives of the relevant Commission services. The following members of the ESAC were present at the meeting on 31 March 1998:

Dr B Blaauboer (ERGATT)	Dr P Botham (ECETOC)
Professor J Castell (Spain)	Dr D Clark (UK)
Dr B Garthoff (EFPIA)	Professor A Guillouzo (France)
Dr C Hendriksen (The Netherlands)	Dr R Lorenzini (Italy)
Professor G Papadopoulos (Greece)	Professor V Rogiers (Belgium)
Dr B Rusche (Eurogroup for Animal Welfare)	Dr O de Silva (COLIPA)
Professor H Spielmann (Germany)	Dr O Svendsen (Denmark)
Professor H. Tritthart (Austria)	Dr M Viluksela (Finland)
Professor E Walum (Sweden)	
Professor M Balls (ECVAM)	Mr G Corcelle (DGXI)
Dr J Fentem (ECVAM)	Dr G Fracchia (DGXII)
Ms S Louhimies (DGXI)	Dr M Robert (DGIII)
Mr A Van Elst (DGXXIV)

General information about the ECVAM skin corrosivity validation study:

- A. The study was coordinated from ECVAM, and the Management Team (MT) was chaired by Dr Julia Fentem (ECVAM). The other four MT members acted as representatives of the “lead laboratories” and each took responsibility for one of the four tests included in the validation study: Dr Rodger Curren (Microbiological Associates Inc., USA; CORROSITEX™) Dr Lesley Earl (Unilever, UK; rat skin TER assay), Mr David Esdaile (Rhône-Poulenc Agro, France; EPISKIN™), and Dr Manfred Liebsch (ZEBET, Germany; Skin²™ assay). The study was principally funded by ECVAM, under the terms of 14 separate contracts with the participating organisations. Professor Michael Balls (ECVAM) and Dr Philip Botham (ESAC; ZENECA CTL, UK) represented the sponsors in any contacts with the MT. In addition to ECVAM, the participating organisations were: Agence du Medicament (France), BASF Aktiengesellschaft (Germany), BIBRA International (UK), COVANCE (UK), Humboldt University (Germany), Huntingdon Life Sciences (UK), INRS (France), Microbiological Associates Inc. (USA), Microbiological Associates Ltd (UK), Rhône-Poulenc Agro (France), Sanofi Recherche (France), Unilever Research (UK), ZEBET, BgVV (Germany) and ZENECA CTL (UK).
- B. This study began in 1996, as a follow-up to a prevalidation study on *in vitro* tests for replacing the *in vivo* Draize rabbit test for skin corrosivity. The main objectives were to: (a) identify tests capable of discriminating corrosives (C) from non-corrosives (NC) for selected groups of chemicals (e.g. organic acids, phenols) and/or all chemicals (single chemical entities only); and (b) determine whether the tests could identify correctly known R35 (UN packing group I) and R34 (UN packing groups II & III) chemicals. The tests selected for inclusion in the validation study were: (a) the rat skin TER assay; (b) CORROSITEX™; (c) the Skin²™ ZK1350 corrosivity test; and (d) EPISKIN™. Each test was conducted in three independent laboratories, according to the principles, criteria and procedures for undertaking validation studies outlined previously by ECVAM in conjunction with international experts in this area. Prediction models for the four tests were clearly defined in the test protocols.
- C. A test set of 60 chemicals was selected by an independent Chemicals Selection Sub-Committee, including organic acids (6C/5NC), organic bases (7C/3NC), neutral organics (9NC), phenols (2C/3NC), inorganic acids (6C/1NC), inorganic bases (2C/2NC), inorganic salts (1C/2NC), electrophiles (3C/5NC) and soaps/surfactants (3NC). The first set of ten coded chemicals was distributed independently of the MT and participating laboratories in June 1996. Further to the satisfactory completion of the first phase of the study, the remaining 50 coded chemicals were distributed in September 1996. The results obtained were submitted to ECVAM’s statistician, Dr Graeme Archer, for independent analysis in consultation with Dr Hermann-Georg Holzhütter (Humboldt University, Berlin, Germany). Data analysis and preparation of the final reports took place between May and October 1997.

D. The rat skin TER assay has been used successfully as a routine in-house test for several years. When used in screening mode, the TER method is employed to predict corrosivity potential rather than the degree of corrosive effect (i.e. potency), and it has been used primarily to guide humane *in vivo* skin testing. The TER assay has been evaluated in several intralaboratory and interlaboratory studies, and it performed creditably in the prevalidation study conducted during 1993 and 1994. The test protocol evaluated in this validation study had been refined on the basis of recommendations from the prevalidation study, to include a dye binding procedure for reducing the number of false positive predictions obtained previously with test materials containing surfactants and solvents. In outline, test materials are applied for up to 24 hr to the epidermal surfaces of skin discs taken from the pelts of humanely killed young rats. Corrosive materials are identified by their ability to produce a loss of normal stratum corneum integrity and barrier function, which is measured as a reduction in the inherent TER below a predetermined threshold level (5kΩ).

Rat Skin TER Assay Prediction Model:

TER (kW)	Treatment time(hours)	Mean disc dye content	C/NC	EU risk phrase	UN packing group
> 5	2 & 24	NM ^a	NC	no label	-
≤ 5	2	-	C	R35	I
	24	-	C	R34	II/III
<i>Surfactants/neutral organics:</i>					
≤ 5	24	≥ +ve control	C	R34	II/III
	24	< +ve control	NC	no label	-

^aNM = not measured

E. The prediction model for the rat skin TER test was used to classify the corrosivity potentials of the 60 test chemicals on the basis of the *in vitro* data obtained in the three laboratories conducting the test. Comparing these *in vitro* classifications with the *in vivo* classifications independently assigned to the chemicals before the blind trial began gave the following key statistical parameters:

Sensitivity:	C	88%
	R34/II & III	18%
	R35/I	88%
Specificity:		72%
Predictivity:	C	72%
	R34/II & III	40%
	R35/I	22%

Accuracy:	C/NC	79%
	R35/R34/NC	55%

The underprediction and overprediction rates for the TER test relative to the study objectives were:

Objective (a):	C v NC	
	underprediction rate	12%
	overprediction rate	28%
Objective (b):	R35/I v R34/II & III v NC	
	underprediction rate	
	R35/I → NC	6%
	R34/II & III → NC	14%
	overprediction rate	
	NC → R35/I	12%
	NC → R34/II & III	16%
	R34/II & III → R35/I	69%*

*unacceptable according to the criteria defined by the MT before undertaking the data analysis

- F. In order for the rat skin TER test to be considered for use for legislative and other purposes, measures will be taken to press for the updating of OECD Testing Guideline 404 and Annex V method B.4 of *Directive 67/548/EEC*.
- G. A statement on the scientific validity of the EPISKINTM assay for skin corrosivity testing was also endorsed by the ESAC on 31 March 1998. The two other methods included in the validation study, CORROSITEX and Skin², did not meet all of the criteria for them to be considered acceptable as replacement tests. The corrosivity potentials of about 40% of the test chemicals could not be assessed with CORROSITEX, although it may be valid for testing specific classes of chemicals (such as organic bases and inorganic acids). The Skin² assay, as conducted in this validation study, had an unacceptably high underprediction rate (57%), although it had a specificity of 100%. It is recognised that both of these methods could be useful if they were incorporated into a tiered testing strategy for skin corrosivity.
